NOISE POLLUTION

Noise pollution is the pollution caused by the high and unsafe level of noise in the environment, It causes lots of health disorders to the human beings, animals and plants,

Some of the main sources of the noise pollution are noise generated by the road traffic, air craft noise, railroads noise, noise generated by the construction (of buildings, highways, city streets, flyovers, etc), industrial noise, noise created in home on daily basis (due to electrical home appliances, plumbing, generators, air conditioners, boilers, fans, etc), and noise from consumer products (like household equipment's, kitchen appliances, vacuum cleaners, washing machine, mixer, juicer, pressure cooker, TV, mobile, dryer, cooler, etc).

High level of the noise causes irritation in the behaviour of many people especially diseased, old people and pregnant women. Unwanted sound causes deafness problem and other chronic disorders to the ear like damage to the ear drum, ear pain, huge nuisance, injuries, physical trauma, bleeding around brain, large bubbles in organs and even death to the marine animals specially whales and dolphins as they use their hearing ability to communicate, find food, defend and survive in water

General awareness should be increased among people and all the rules should be followed seriously by everyone in order to control the unsafe sound level in the environment. Unnecessary use of things generating high pitch sound should be reduced in the home or outside the home young children and students should be motivated to not get involved in the high sound producing acts like use of high sound generating equipment's and instruments on the occasions. Use of high-level sound generating fire crackers should be reduced during the occasions like festivals, parties, marriages
